

Speed Learning

2015 Survox Summit

Speed Learning – Time Savers, Quick & Useful Tips on how to get this done fast and efficiently

What is Speed Learning?

- Speed Learning is a collection of methods of learning which attempts to attain higher rates of learning without unacceptable reduction of comprehension or retention.
- Speed Learning is closely related to speed reading, but encompasses other methods of learning, such as observation, listening, conversation, questioning and reflection.

Speed Learning Rules!

- Each presenter/group will have 5 minutes to present
- Then each presenter will introduce themselves
- There will be a brief transition between each presenter/group
- There will be a few minutes at the end for Q&A with all presenters
- Overall goal is that everyone at least learns something new

Speed Learning Presenters

Presenters	Company	Topic
Pat Costello	LHK Partners Inc.	Automating Processes
Frank Barney, Cora Coleman & Taylor Zigo	Venture Data	Project Setup Project Management Data Delivery
Jason Bentrup	MaritzCX	Jquery/JSON To Populate Data

Automating processes using Survox,
PowerShell and Task Scheduler

mentorRun_ps1.txt

PowerShell example of running a mentor program

\$program = "C:\CFMC\GO\mentor.exe"

\$arguments = "logit.spx -error"

start-process \$program \$arguments

mailnotify_ps1.txt

Example of sending an email with attachment if an error found in output file and another message if no errors.

Can be modified to if file exists, if no error proceed, or for more advanced error catching could use try/catch logic.

#email information

\$EmailTo = "Send@email.com"

\$EmailFrom = "From@email.net"

\$SmtpServer = "relay.name.net"

#error file and the error key (text in file to determine error)

\$ErrorFile = "C:\MyScripts\Error.prt"

\$ErrorText = "errors!"

#if fail

\$Subject1 = "Hey, your imporant job failed."

\$Body1 = "Your stuff failed real bad."

#if complete

\$Subject2 = "Step1 is complete"

\$Body2 = "Good job, step 1 is done."

```
$fail = Get-Content $ErrorFile | Select-String $ErrorText -quiet -casesensitive
```

```
if ($fail -eq "True")
```

```
{
```

```
Send-MailMessage `
```

```
-To $EmailTo `
```

```
-From $EmailFrom `
```

```
-Body $Body1 `
```

```
-Subject $Subject1 `
```

```
-Attachments $ErrorFile `
```

```
-smtpServer $SmtpServer
```

```
}
```

```
else
```

```
{
```

```
Send-MailMessage `
```

```
-To $EmailTo `
```

```
-From $EmailFrom `
```

```
-Body $Body2 `
```

```
-Subject $Subject2 `
```

```
#-Attachments $ErrorFile ` # commented out to not send an attachment
```

```
-smtpServer $SmtpServer
```

AddWorksheetHTM_ps1.txt

Power Shell example of importing a .htm file into a new Excel worksheet

The new worksheet is given the run date as the worksheet name

\$ExcelFile = "C:\example\Book1.xlsx"

\$WEBFile = "C:\example\report.htm"

\$sheetname = Get-Date -format M.d.yyyy

#create Excel object

\$Excel = New-Object -ComObject Excel.Application

\$Excel.visible = \$false # change to \$true for debugging else \$false

\$Excel.DisplayAlerts = \$false

#Open workbook

\$wb = \$excel.Workbooks.Open(\$ExcelFile)

add new worksheet

\$worksheet = \$wb.WorkSheets.Add()

\$worksheet.Name = "\$sheetname"

#Define the connection string and where the data is supposed to go

\$TxtConnector = ("URL;" + \$WEBfile)

\$CellRef = \$worksheet.Range("A1")

#Build, use and remove the text file connector

\$Connector = \$worksheet.QueryTables.add(\$TxtConnector,\$CellRef)

\$worksheet.QueryTables.item(\$Connector.name).Refresh()

\$worksheet.QueryTables.item(\$Connector.name).delete()

\$worksheet.UsedRange.EntireColumn.AutoFit()

#Save Excel file

#51 = xlOpenXMLWorkbook (without macro's in 2007-2013, xlsx)

#52 = xlOpenXMLWorkbookMacroEnabled (with or without macro's in 2007-2013, xlsm)

\$worksheet.SaveAs(\$ExcelFile,51)

\$Excel.Quit()

#Make sure ComObjects close

[System.Runtime.InteropServices.Marshal]::ReleaseComObject(\$Excel)

ApendToWorksheet_ps1.txt

```
# PowerShell example of appending a tab delimited file to the  
end of an Excel worksheet
```

```
#Input files and sheet name
```

```
$ExcelFile = "C:\example\W73report_request.xls"
```

```
$SheetName = "w73report_request"
```

```
$TextFile = "C:\example\testfile.txt"
```

```
#Open Excel object
```

```
$objExcel = New-Object -ComObject Excel.Application
```

```
$objExcel.Visible = $false # change to $true for debugging  
else $false
```

```
#Open workbook
```

```
$objWorkbook = $objExcel.Workbooks.Open($ExcelFile)
```

```
$objWorksheet = $objWorkbook.Worksheets.item($SheetName)
```

```
$objWorksheet.Activate()
```

```
#determine last row
```

```
$LastRow = $objWorksheet.UsedRange.Rows.Count + 1
```

```
$LastRow
```

```
$objExcel.Range("A" + $LastRow).Activate()
```

```
#Define the connection string and where the data is supposed to go
```

```
$TxtConnector = ("TEXT;" + $Textfile)
```

```
$CellRef = $objWorksheet.Range("A" + $LastRow)
```

```
#Build, use and remove the text file connector
```

```
$Connector = $objWorksheet.QueryTables.add($TxtConnector,$CellRef)
```

```
$objWorksheet.QueryTables.item($Connector.name).Refresh()
```

```
$objWorksheet.QueryTables.item($Connector.name).delete()
```

```
$objWorksheet.UsedRange.EntireColumn.AutoFit()
```

```
#Save and close Excel
```

```
$objWorkbook.Save()
```

```
$objWorkbook.Close()
```

```
#Closing COM object 3 ways, It has a habit of the process hanging  
otherwise
```

```
$objExcel.Quit()
```

```
[System.Runtime.InteropServices.Marshal]::ReleaseComObject($objExcel)
```

```
Stop-Process -Name EXCEL -Force
```

RunProg_bat.txt

REM Bat file to run a PowerShell program. Advance settings allows running with Windows task monitor when the user is not logged onto the machine.

```
@ECHO OFF
```

```
PowerShell -NoProfile -ExecutionPolicy Bypass -Command "& {Start-Process  
PowerShell -ArgumentList '-NoProfile -ExecutionPolicy Bypass -File  
"C:\File\directory\on\the\PC\RunProg.ps1"' -Verb RunAs}"
```

Task schedule 1

Location: \

Author: LHKNET\pcostello

Description:

Security options

When running the task, use the following user account:
LHKNET\pcostello [Change User or Group...](#)

Run only when user is logged on

Run whether user is logged on or not

Do not store password. The task will only have access to local computer resources.

Run with highest privileges

Task schedule 2

- Daily
- Weekly
- Monthly

Recur every: weeks on:

- Sunday
- Monday
- Tuesday
- Wednesday
- Thursday
- Friday
- Saturday

Advanced settings

Delay task for up to (random delay):

Repeat task every:

for a duration of:

Stop all running tasks at end of repetition duration

Stop task if it runs longer than:

Expire:

Synchronize across time zones

Task schedule 3

Program/script:

Add arguments (optional):

Take some the mundane tasks out
of your day

Take some the mundane tasks out of your day.

- Using your linux Cron
- Edit crontab -e
- Set up to run at any time during the day, week, year
 - Minute
 - Hours
 - Day
 - Month
 - Weekday
- Moving files or email files when you need them
- Maintain your server by archiving log files
- Running reports and placing them into the shared files area for supervisors and clients

#Daily Callbacks

```
30 05 * * 1-5 csh -c "setenv CFMC  
/cfmc/;/cfmc/websurv/studies/reports/scripts/jobs/daycbam.csh >&  
/cfmc/websurv/studies/reports/scripts/jobs/daycbam.log"
```

Recovering Overwritten Data
From Questions in a
WebSurvent project

Recovering Overwritten Data From Questions in a WebSurvent project

Htmlresp log file info:

File name structure:

<studycode>.htmlresp/<studycode>_<password or ivid>.htmlresp

(uses password if websurvent and Interviewer ID if webcati)

Eg: /cfmc/intvr_logs/abcde.htmlresp/abcde_ercqsm4wnmu84.htmlresp

Survent concatenates to the file if it is there when it starts up, so you don't have to concatenate files. The most recent response is always after any previous responses in the file in the case of backups and suspends.

Htmlresp record formats:

1. Question Response:

mm:dd hh:mm:ss Label:Data

eg. answer to S1B:, label starts in column 16 of record

09:08 09:46:11 S1B:01,10, , , , , , , , , , , , , ,

2. Data modification:

mm:dd hh:mm:ss NO QQ:mod data Location data

The data location always starts in column 31, eg. Case id (last line in file):

09:08 11:08:47 NO QQ:mod data 1.10 1530000762

Recovering Overwritten Data From Questions in a WebSurvent project (cont)

Process:

1. Gather the files you need to a directory. Use the `~input files=` statement to read them all, and set up a memory area to save data to, here is the flow reading through the file:

```
rec1: |1.10000 data buffer          |1000jkkkkj1.200 memory buffer      |
recn: |1.10000 data buffer cleared   |10001.200 memory buffer not cleared|
last: |1.10000 data buffer cleared   |10001.200 memory ready to retrieve |
```

2. Use the `'~merge'` command set to replace the missing data

SurVox wishes:

1. Put the filename at the top of any new file so can know when the file starts, and label the caseid record
2. Be able to know when you are at the beginning or end of each file in a `"files="` statement, eg.

```
If FirstCaseInCurrentFile
```

```
ExeofCurrentfile
```

```
If LastcaseInCurrentFile
```

3. An option in `~merge` to write the records not written in the first file to a second file

GetHtmlRespData.spx

```
~comment
